Drug effects on psychomotor performance

Cannabidiol (CBD), a major nonpsychotropic constituent of Cannabis, has multiple pharmacological actions, including anxiolytic, antipsychotic, antiemetic and anti-neuroinflammatory effects. Long-Term Effects. People who inject methamphetamine are at increased risk of contracting infectious diseases such as HIV and hepatitis B and C. GHB or Gamma Hydroxybutyrate (C₄H₈O₃) is a central nervous system (CNS) depressant that is commonly referred to as a "club drug" or "date rape" drug. Recreational drug use is the use of a psychoactive drug to induce an altered state of consciousness for pleasure, by modifying the perceptions, feelings, and emotions. The main psychoactive drugs are from the Cannabis plant intended for medical or recreational use. Maternal drug use during pregnancy may result in neonatal withdrawal. This statement presents current information about the clinical presentation, differential diagnosis, and treatment of neonatal withdrawal. This topic contains 451 study abstracts on Statin Drugs indicating they may contribute to Statin-Induced Pathologies, and Chemically-Induced Liver Damage.
